PERCONA TRAINING

MySQL Query Patterns, Optimized

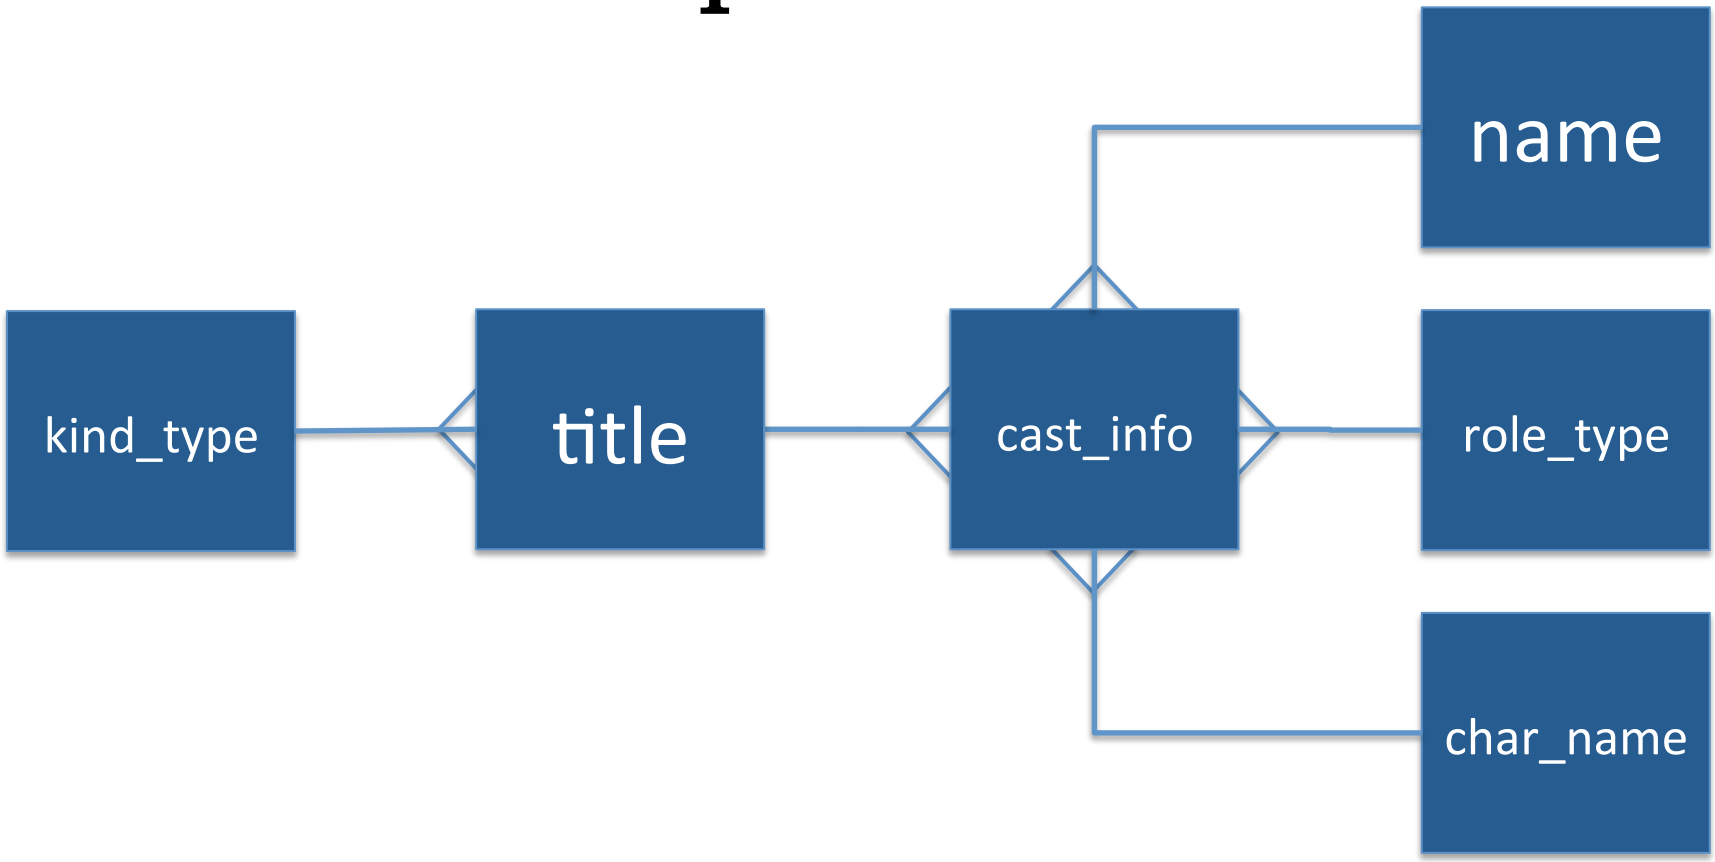
Percona Webinar

Bill Karwin

How Do We Optimize?

- Identify queries.
- Measure optimization plan and performance.
  - EXPLAIN
  - SHOW SESSION STATUS
  - SHOW PROFILES
- Add indexes *and/or* redesign the query.

Example Database



PERCONA TRAINING

Common Query Patterns

1. Exclusion Joins
2. Random Selection
3. Greatest per Group
4. Dynamic Pivot
5. Relational Division

PERCONA TRAINING

Query Patterns

EXCLUSION JOINS

Assignment:

"I want to find recent movies that had no director."

Not Exists Solution

```
SELECT t.title
FROM title t
WHERE kind_id = 1
AND production_year >= 2005
AND NOT EXISTS (
   SELECT * FROM cast_info c
   WHERE c.movie_id = t.id
      AND c.role_id = 8 /* director */
);
```

Movies

In the range of recent years

Correlated subquery to find a director for each movie

Not Exists Solution

```
SELECT t.title
FROM title t
WHERE kind_id = 1
AND production_year >= 2005
AND NOT EXISTS (
   SELECT * FROM cast_info c
   WHERE c.movie_id = t.id
      AND c.role_id = 8
);
```

I gave up after waiting > 1 hour

PERCONA TRAINING

Indexes: the Not-Exists Solution

```
CREATE INDEX k_py
ON title (kind_id, production_year);

CREATE INDEX m_r
ON cast_info (movie_id, role_id);
```

EXPLAIN: the Not-Exists Solution

id	select_type	table	type	key	ref	rows	Extra
1	PRIMARY	t	range	k_py	NULL	189846	Using where
2	DEPENDENT SUBQUERY	c	ref	m_r	t.id, const	105654	Using index

Dependent subquery executes once for each set of values in outer

The correlated subquery is executed 189k times!

At least both table references use indexes

A covering index is best—if the index fits in memory

Not Exists Solution

```
SELECT t.title
FROM title t
WHERE kind_id = 1
AND production_year >= 2005
AND NOT EXISTS (
   SELECT * FROM cast_info c
   WHERE c.movie_id = t.id
      AND c.role_id = 8
);
```

Better, but when the indexes aren't in memory, it's still too slow

Buffer Pool

- It's crucial that queries read an index from memory; I/O during an index scan kills performance.

```
[mysqld]
innodb_buffer_pool_size = 64M # wrong
innodb_buffer_pool_size =  2G # better
```

Not Exists Solution

```
SELECT t.title
FROM title t
WHERE kind_id = 1
AND production_year >= 2005
AND NOT EXISTS (
   SELECT * FROM cast_info c
   WHERE c.movie_id = t.id
      AND c.role_id = 8
);
```

4× faster after increasing size of buffer pool.

SHOW SESSION STATUS

- Shows the real count of row accesses for your current session.

```
mysql> FLUSH STATUS;
mysql> ... run a query ...
mysql> SHOW SESSION STATUS LIKE 'Handler%';
```

Status: the Not-Exists Solution

```
+----------------------------+--------+
| Variable_name              | Value  |
+----------------------------+--------+
| Handler_commit             | 7      |
| Handler_delete             | 0      |
| Handler_discover           | 0      |
| Handler_prepare            | 0      |
| Handler_read_first         | 3      |
| Handler_read_key           | 652715 |
| Handler_read_last          | 0      |
| Handler_read_next          | 652710 |
| Handler_read_prev          | 0      |
| Handler_read_rnd           | 0      |
| Handler_read_rnd_next      | 39     |
| Handler_rollback           | 0      |
| Handler_savepoint          | 0      |
| Handler_savepoint_rollback | 0      |
| Handler_update             | 0      |
| Handler_write              | 19     |
+----------------------------+--------+
```

read_key: lookup by index, e.g. each lookup in *cast_info,* plus the first row in *title*

read_next: advancing in index order, e.g. the range query for rows in *title* after the first row

SHOW PROFILE

- Enable query profiler for the current session.

```
mysql> SET PROFILING = 1;
```

- Run a query.

```
mysql> SELECT t.title FROM title t ...
```

- Query the real execution time.

```
mysql> SHOW PROFILES;
```

- Query detail for a specific query.

```
mysql> SHOW PROFILE FOR QUERY 1;
```

Profile: the Not-Exists Solution

```
+--------------------+----------+
| Status             | Duration |
+--------------------+----------+
| executing          | 0.000002 |
| Sending data       | 0.000011 |

| cleaning up        | 0.000004 |
+--------------------+----------+
```

Thousands of iterations of correlated subqueries caused the profile information to overflow!

Not-In Solution

```
SELECT title
FROM title
WHERE kind_id = 1
AND production_year >= 2005
AND id NOT IN (
   SELECT movie_id FROM cast_info
   WHERE role_id = 8
);
```

Not a correlated subquery

Indexes: the Not-In Solution

```
CREATE INDEX k_py
ON title (kind_id, production_year);

CREATE INDEX r_m
ON cast_info (role_id, movie_id);
```

EXPLAIN: the Not-In Solution

id	select_type	table	type	key	ref	rows	Extra
1	PRIMARY	title	range	k_py	NULL	189846	Using where
1	DEPENDENT SUBQUERY	cast_ info	index_subquery	m_r	func, const	1	Using index; Using where

But somehow MySQL doesn't report a different select type

Status: the Not-In Solution

Variable_name	Value
Handler_commit	1
Handler_delete	0
Handler_discover	0
Handler_prepare	0
Handler_read_first	0
Handler_read_key	93245
Handler_read_last	0
Handler_read_next	93244
Handler_read_prev	0
Handler_read_rnd	0
Handler_read_rnd_next	0
Handler_rollback	0
Handler_savepoint	0
Handler_savepoint_rollback	0
Handler_update	0
Handler_write	0

A fraction of the number of rows accessed by the NOT EXISTS solution

Profile: the Not-In Solution

Status	Duration
starting	0.000095
checking permissions	0.000004
checking permissions	0.000007
Opening tables	0.000030
System lock	0.000012
init	0.000038

Outer-Join Solution

```
SELECT t.title
FROM title t
LEFT OUTER JOIN cast_info c
  ON t.id = c.movie_id
  AND c.role_id = 8
WHERE t.kind_id = 1
AND t.production_year >= 2005
AND c.movie_id IS NULL;
```

Try to find a director for each movie using a join

If no director is found, that's the one we want

Indexes: the Outer-Join Solution

```
CREATE INDEX k_py
ON title (kind_id, production_year);

CREATE INDEX m_r
ON cast_info (movie_id, role_id);
```

EXPLAIN: the Outer-Join Solution

id	select_type	table	type	key	ref	rows	Extra
1	SIMPLE	t	range	k_py	NULL	189846	Using where
1	SIMPLE	c	ref	m_r	t.id, const	105654	Using where; Using index; Not exists

Special “not exists” optimization

Status: the Outer-Join Solution

Variable_name	Value
Handler_commit	1
Handler_delete	0
Handler_discover	0
Handler_prepare	0
Handler_read_first	0
Handler_read_key	93245

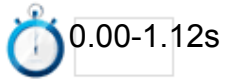
closing tables	0.000034
freeing items	0.000210
logging slow query	0.000003
cleaning up	0.000005

Offset Solution



```
SELECT ROUND(RAND() * COUNT(*))
FROM title
WHERE kind_id = 1;

SELECT *
FROM title
WHERE kind_id = 1
LIMIT 1 OFFSET $random;
```

PERCONA TRAINING

Indexes: the Offset Solution

```
CREATE INDEX k
ON title (kind_id);
```

EXPLAIN: the Offset Solution

id	select_type	table	type	key	ref	rows	Extra
1	SIMPLE	title	ref	k	const	787992	

Status: the Offset Solution

```
+----------------------------+--------+
| Variable_name              | Value  |
+----------------------------+--------+
| Handler_commit             | 1      |
| Handler_delete             | 0      |

PERCONA TRAINING

Query Patterns

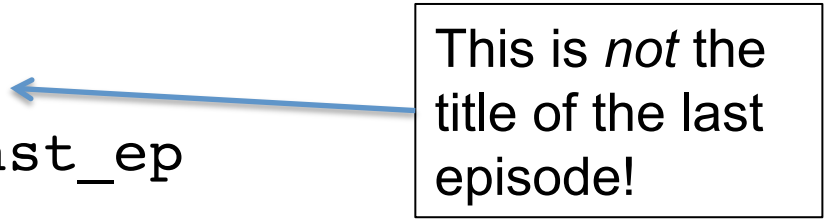
GREATEST PER GROUP

Assignment:

"I want the last episode of every TV series."

Getting the Last Episode

```
SELECT tv.title, ep.title,
  MAX(ep.episode_nr) AS last_ep
FROM title ep
JOIN title tv ON tv.id = ep.episode_of_id
WHERE ep.kind_id = 7 /* TV show */
GROUP BY ep.episode_of_id ORDER BY NULL;
```



Why Isn't It?

- The query doesn't necessarily return the title from the row where `MAX(ep.episode_nr)` occurs.
- Should the following return the title of the *first* episode or the *last* episode?

```
SELECT tv.title, ep.title,
  MIN(ep.episode_nr) AS first_ep
  MAX(ep.episode_nr) AS last_ep
FROM . . .
```

Exclusion Join Solution

```
SELECT tv.title, ep1.title, ep1.episode_nr
FROM title ep1
LEFT OUTER JOIN title ep2
  ON ep1.kind_id = ep2.kind_id
  AND ep1.episode_of_id = ep2.episode_of_id
  AND ep1.episode_nr < ep2.episode_nr
JOIN title tv ON tv.id = ep1.episode_of_id
WHERE ep1.kind_id = 7
  AND ep1.episode_of_id IS NOT NULL
  AND ep1.episode_nr >= 1
  AND ep2.episode_of_id IS NULL;
```

Try to find a row *ep2* for the same show with a greater *episode_nr*

If no such row is found, then *ep1* must be the last episode for the show

Indexes: the Exclusion-Join Solution

```
CREATE INDEX k_ep_nr
ON title (kind_id, episode_of_id, episode_nr);
```

EXPLAIN: the Exclusion-Join Solution

id	select_type	table	type	key	ref	rows	Extra
1	SIMPLE	ep1	ref	k_py	const	787992	
1	SIMPLE	ep2	ref	k_ep_nr	const, ep1.episode_of_id	7879	Using where; Using index
1	SIMPLE	tv	eq_ref	PRIMARY	ep1.episode_of_id	1	

Status: the Exclusion-Join Solution

Variable_name	Value

A lot of time is spent moving rows around

Derived-Table Solution

```
SELECT tv.title, ep.title, ep.episode_nr
FROM (
  SELECT kind_id, episode_of_id,
    MAX(episode_nr) AS episode_nr
  FROM title
  WHERE kind_id = 7
  GROUP BY kind_id, episode_of_id
) maxep
JOIN title ep USING (kind_id, episode_of_id, episode_nr)
JOIN title tv ON tv.id = ep.episode_of_id;
```

Generate a list of the greatest episode number per show

PERCONA TRAINING

Indexes: the Derived-Table Solution

```
CREATE INDEX k_ep_nr

Query Patterns

DYNAMIC PIVOT

Assignment:

"I want the count of movies, TV, and video games per year—in columns."

Not Like This

```
SELECT k.kind, t.production_year, COUNT(*) AS Count
FROM kind_type k
JOIN title t ON k.id = t.kind_id
WHERE production_year BETWEEN 2005 AND 2009
GROUP BY k.id, t.production_year;
```

```
+-------------+-----------------+--------+
| kind        | production_year |  Count |
+-------------+-----------------+--------+
| movie       |            2005 |  13807 |
| movie       |            2006 |  13916 |
| movie       |            2007 |  14494 |
| movie       |            2008 |  18354 |
| movie       |            2009 |  23714 |
| tv series   |            2005 |   3248 |
| tv series   |            2006 |   3588 |
| tv series   |            2007 |   3361 |

Query Patterns

RELATIONAL DIVISION

Assignment:

"I want to see movies with all three of keywords *espionage*, *nuclear-bomb*, and *ejector-seat*."

Not Movies with *One* Keyword

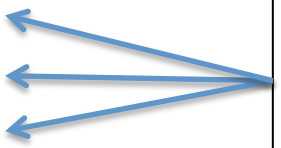
```
SELECT t.title, k.keyword FROM keyword k
JOIN movie_keyword mk ON k.id = mk.keyword_id
JOIN title t ON mk.movie_id = t.id
WHERE k.keyword IN ('espionage', 'nuclear-bomb', 'ejector-seat');

+--------------------------+-------------+
| title                    | keyword     |
+--------------------------+-------------+
| 2 Fast 2 Furious         | ejector-seat |
| Across the Pacific       | espionage   |
| Action in Arabia         | espionage   |
. . .
| You Only Live Twice      | espionage   |
| Zombie Genocide          | nuclear-bomb |
| Zombies of the Strat     | espionage   |
+--------------------------+-------------+
705 rows in set (12.97 sec)
```

This Won't Work

```
SELECT t.title, k.keyword
FROM keyword k
JOIN movie_keyword mk ON k.id = mk.keyword_id
JOIN title t ON mk.movie_id = t.id
WHERE k.keyword = 'espionage'
  AND k.keyword = 'nuclear-bomb'
  AND k.keyword = 'ejector-seat';

0 rows in set (12.97 sec)
```



It's impossible for one column to have three values on a given row

Only Movies with All Three

```
+-----------+-----------------------------------+
| title     | keywords                          |
+-----------+-----------------------------------+
| Goldfinger | ejector-seat,espionage,nuclear-bomb |
+-----------+-----------------------------------+
```

Group-by Solution

```
SELECT t.title, GROUP_CONCAT(k.keyword) AS keywords
FROM title t
JOIN movie_keyword mk ON t.id = mk.movie_id
JOIN keyword k ON k.id = mk.keyword_id
WHERE k.keyword IN
  ('espionage', 'nuclear-bomb', 'ejector-seat')
GROUP BY mk.movie_id
HAVING COUNT(DISTINCT mk.keyword_id) = 3
ORDER BY NULL;
```

Indexes

```
CREATE INDEX k_i
ON keyword (keyword, id);

CREATE INDEX k_m
ON movie_keyword (keyword_id, movie_id);
```

EXPLAIN: the Group-by Solution

Query Patterns

CONCLUSIONS

Conclusions

- Use all tools to measure query performance
  - EXPLAIN
  - Session Status
  - Query Profiler
- Test with real-world data, because the best solution depends on the volume of data you're querying.
- Allocate enough memory to buffers so the indexes you need stay resident in RAM.
